College of Engineering, Computer Science, and Technology

California State University, Los Angeles

Background

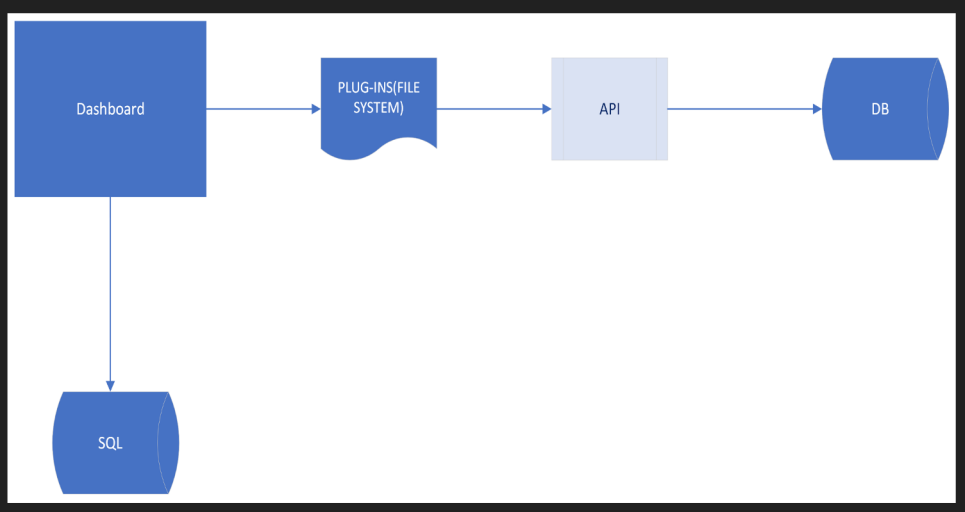

QTC (Quality, Timeliness, Customer Service) handles all medical, disabilities, or occupational health services through a medical focused examination and diagnostics test. Need a centralized location to investigate errors from different sources.

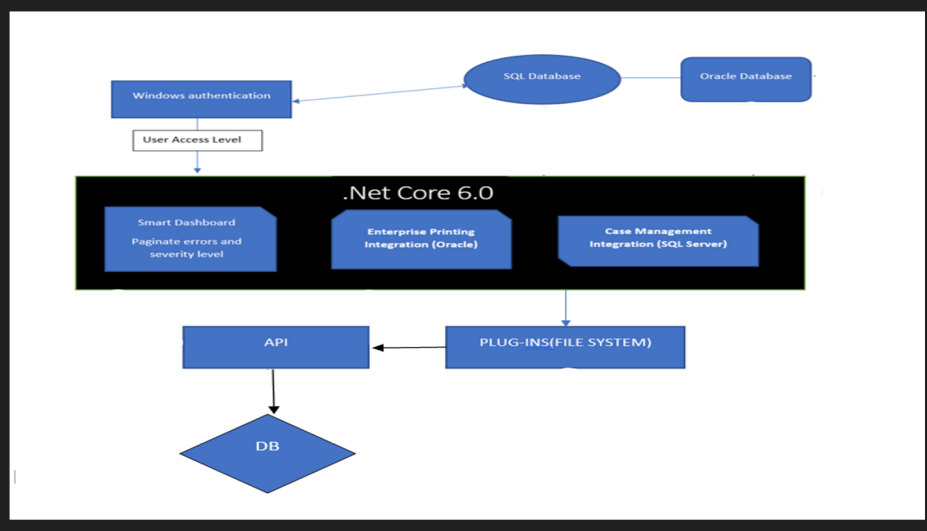

Objective

Create a smart dashboard:

- Display errors from different sources
- Table features:
  - Sort
  - Search
  - Paginate
  - Error window
- Help window

Architecture

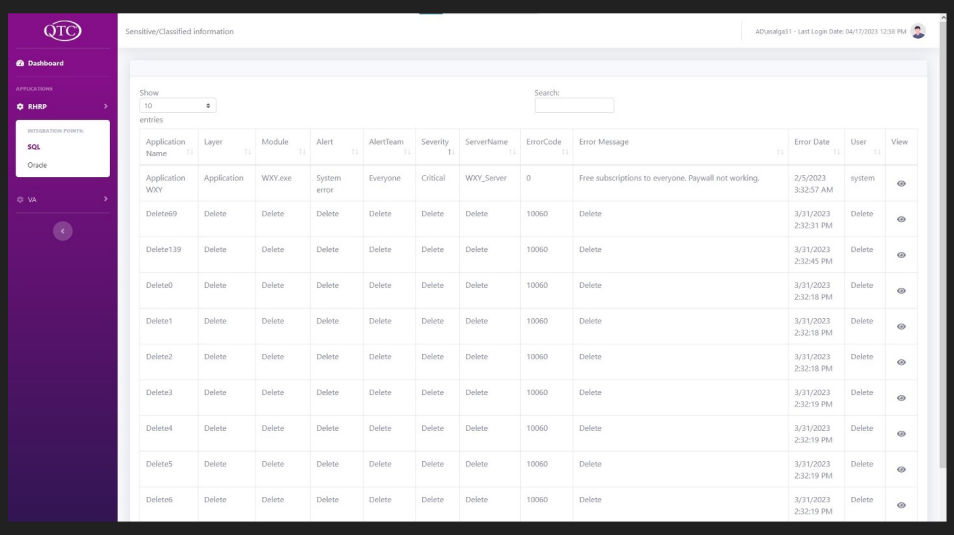

Our dashboard can convert data from an API or a Database that will then be displayed to the User Interface.

Our Dashboard gives the user the ability to filter, paginate, and search through the error data converted.

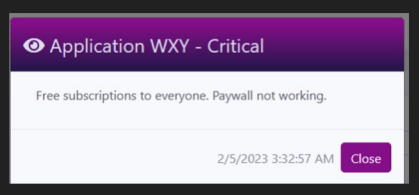

Result

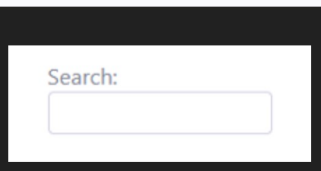

Some dashboard functionalities includes displaying error messages in full length after clicking on view icon as well as a descriptive help button with a question mark icon.

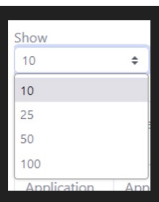

Dashboard:

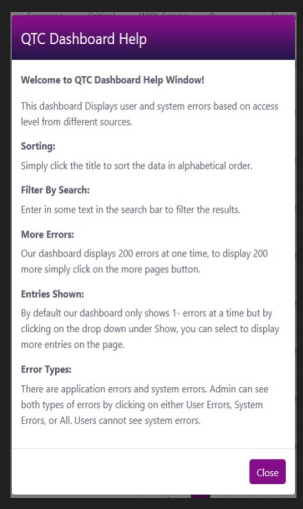

Features:

Tools and Technologies

GitHub, C#, Visual Studio, Microsoft ASP.NET, Azure, Bootstrap, HTML5, CSS3, JS, Microsoft SQL Server
